A case for profile-guided optimizations (PGO)

A case for profile-guided optimizations (PGO)

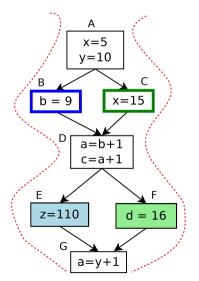

Profile-guided analysis on paths

Summary

- Profile-guided analysis across paths is stronger—can capture correlations between control-flow of basic-blocks
- Collecting path-profiles seems challenging—requires "recording" of a sequence of basic-blocks

Profile-guided analysis on paths

Summary

- Profile-guided analysis across paths is stronger—can capture correlations between control-flow of basic-blocks
- Collecting path-profiles seems challenging—requires "recording" of a sequence of basic-blocks

Profiling acyclic paths

Introduction

Ball-Larus Acyclic Profiling [Ball & Larus, MICRO'96]

- Core idea: assign an identifier to each path, that can be calculated efficiently at runtime
- Record frequencies against these identifiers (instead of a sequence of node identifiers)

Profiling acyclic paths

Ball-Larus Acyclic Profiling [Ball & Larus, MICRO'96]

- Core idea: assign an identifier to each path, that can be calculated efficiently at runtime
- Record frequencies against these identifiers (instead of a sequence of node identifiers)

Capturing still longer paths (k-iteration paths)

- Allows capturing correlations across loop iterations [Roy & Srikant, CGO'09]; a generalization of the Ball-Larus algorithm
- Subsequent work by other groups [D'Elia & Demetrescu, OOPSLA'13]; uses a prefix forest to record BL paths

Profile-guided analyses

- Code understanding
 - Can expose refactoring opportunities

Profile-guided analyses

- Code understanding
 - Can expose refactoring opportunities
- Program testing and verification
 - Data-driven synthesis of invariants
 - Guided testing for low frequency paths

Profile-guided analyses

- Code understanding
 - Can expose refactoring opportunities
- Program testing and verification
 - Data-driven synthesis of invariants
 - Guided testing for low frequency paths
- Profile-guided optimizations

- **Speculation**: check and retry
 - eg. value speculation
 - Can impact code size (significant impact w/o speculation support in hardware)

- **Speculation**: check and retry
 - eg. value speculation
 - Can impact code size (significant impact w/o speculation support in hardware)
- Compensation code
 - eg. superblock scheduling
 - Can impact code size

- **Speculation**: check and retry
 - eg. value speculation
 - Can impact code size (significant impact w/o speculation support in hardware)
- Compensation code
 - eg. superblock scheduling
 - Can impact code size
- Error resilient modules
 - modules for statistical summarization on samples, generate data for ML models
 - No impact on code size

- **Speculation**: check and retry
 - eg. value speculation
 - Can impact code size (significant impact w/o speculation support in hardware)
- Compensation code
 - eg. superblock scheduling
 - Can impact code size
- Error resilient modules
 - modules for statistical summarization on samples, generate data for ML models
 - No impact on code size
- Optimizations that don't impact correctness
 - eg. register allocation
 - No impact on code size

Why is path-profile-guided analysis hard?

- There has been enough interest in path-profile-guided analysis and optimizations....
- ...however, designing path-profile-guided variants of traditional optimizations remained hard
- ...hard enough to justify publications per optimization
 - Gupta, Benson, Fang. Path profile guided partial dead code elimination using predication. PACT '97.
 - Gupta, Benson, Fang. Path profile guided partial redundancy elimination using speculation. ICCL '98.
 - ...

Profile Guided Optimization is easy with HPSSA Form

```
// Function to process "llvm.tau" function intrinsic.
   visitTauNode() {
     SpecValueLatticeElement TauState = getValueState(&Tau).
       beta = getValueState(Tau.getOperand(1)),
       x0 = getValueState(Tau.getOperand(0));
     if (TauState isOverdefined())
       return (void)markOverdefined(&Tau):
9
     for (unsigned i = 1, e = (Tau.getNumOperands() - 1); i != e; ++i){
10
       SpecValueLatticeElement IV = getValueState(Tau.getOperand(i)):
11
       beta.mergeIn(IV):
12
       NumActiveIncoming++;
13
       if (beta.isOverdefined())
14
       break:
15
16
17
     beta.mergeIn(x0):
18
     if (beta isConstant())
19
       TauState.markSpeculativeConstant(beta.getConstant());
20
21
     if (beta.isConstantRange())
       TauState.markSpeculativeConstantRange(beta.getConstantRange()):
23
24
     if (beta.isOverdefined() x0.isOverdefined())
25
       TauState.markOverdefined():
26
27
```

```
1 // Omit handling of "llvm.tau" intrinsic
 2 // as a regular Instruction.
 3 for (auto& I : *&(*(BB))) {
     CallInst* CI = dyn_cast<CallInst>(&I);
     if (CI != NULL) {
       Function* CF = CI->getCalledFunction():
       if (CF != NULL &&
       CF->getIntrinsicID() ==
         Function::lookupIntrinsicID("llvm.tau")){
         visitTauNode(I):
11
       } else {
         visit(I):
14
       else {
15
       visit(I):
16
17 }
```

Using HPSSAPass [It is easy!]

- Include the header file HPSSA.h to use llvm::HPSSAPass class.
- Load shared object using opt tool. opt -load HPSSA.cpp.so ...

```
#include <HPSSA.h> // import the header.
     #include <SCCP.h>
     class SpecSCCPPass : public PassInfoMixin<SpecSCCPPass> {
5
       public: PreservedAnalyses run(Function &F.
       FunctionAnalysisManager &AM):
     }:
9
10
     PreservedAnalyses SpecSCCPPass::run(Function &F.
11
     FunctionAnalysisManager &AM) {
12
       if (F.getName() != "main")
13
         return PreservedAnalyses::all():
14
15
       HPSSAPass hpssaUtil: // Make a HPSSAPass Object.
16
       hpssaUtil.run(F, AM); // Call the HPSSAPass::run() function.
17
18
       std::vector<Instruction *> TauInsts
19
       = hpssaUtil.getAllTauInstrunctions(F): // Calling HPSSA utility function.
20
21
       std::cout << "\t\tTotal Tau Instructions : " << TauInsts.size() << "\n":
22
       . . .
23
24
25
     /// [output] Total Tau Instructions : 7
```

Speculative Pass using HPSSA: SSCCP

```
1 // Running Standard SCCP Pass.
                                                               1 // Running Speculative SCCP on HPSSA Form.
 2 int main() {
                                                                  int main() {
     int x = 2, m, n, y, z = 9, c = 1;
                                                                    int x = 2, m, n, y, z = 9, c = 1;
     std::cin >> m:
                                                                    std::cin >> m :
     switch( m ) {
                                                                    switch( m ) {
       case 2 : x = 2 * c + 5; n = 10; break;
                                                                     case 2 : x = 2 * c + 5; n = 10; break;
       case 4: x = 2 * c + 5; n = x - 2; break;
                                                                     case 4 : x = 2 * c + 5; n = x - 2; break;
       case 6 : x = 2 * c + 1; n = x + 2; break;
                                                                     case 6 : x = 2 * c + 1; n = x + 2; break;
       default : break:
                                                                     default : break:
10
                                                              10
11
                                                              11
      y = 2 * x + 10;
                                                                     y = 2 * x + 10;
13
                                                              13
14
     } else {
                                                              14
                                                                    } else {
15
        z = n + 3 * x;
                                                              15
                                                                      z = n + 3 * x ; // n : Speculative Constant 5
16
       switch (z) {

The Hot Path SSA Form (HPSSA)

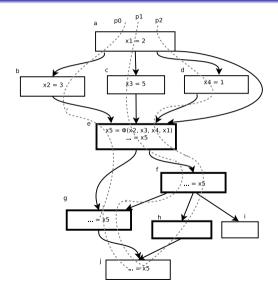

Semantics of a ϕ -function

$$y=\phi(x_1,x_2,\ldots,x_n)$$

Semantics of a au-function

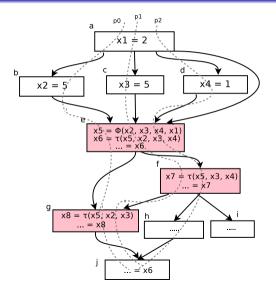

$$au(x_0, x_1, x_2, \dots, x_n) = \left\{ egin{array}{ll} x_0 & ext{safe interp.} \\ \phi(x_1, x_2, \dots, x_n) & ext{speculative interp.} \end{array}
ight.$$

The SSA form

No frequent path carrying:

- def $x_2 = 3$ to use at block **f**
- def $x_4 = 1$ to use at block **g**
- def $x_1 = 2$ to either **f** or **g**

No frequent path carrying:

- def $x_2 = 3$ to use at block **f**
- def $x_4 = 1$ to use at block **g**

Properties

If a program is in the Hot Path SSA form, then,

• each use of a variable is reachable by a single definition; [SSA-like form]

Properties

If a program is in the Hot Path SSA form, then,

- each use of a variable is reachable by a single definition; [SSA-like form]
- safe interpretation: [supports traditional analysis]
 - each use of a variable is reachable by the meet-over-all-paths reaching definition chains;

Properties

If a program is in the Hot Path SSA form, then,

- each use of a variable is reachable by a single definition; [SSA-like form]
- safe interpretation: [supports traditional analysis]
 - each use of a variable is reachable by the *meet-over-all-paths* reaching definition chains;
- speculative interpretation: [supports profile-guided analysis]
 - each use of a variable in a basic-block is reachable by the meet-over-frequent-paths
 reaching definitions. a

^aor the meet-over-all-paths reaching definition chains, if the use is not reachable from any meet-over-hot-paths reaching definition chain

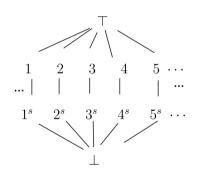

Speculative Sparse Conditional Constant Propagation (SSCCP)

- Introduce new speculative values $\{\ldots,1^s,2^s,\ldots\}\in C^S$
- Operation with speculative values result in speculative results (with same semantics as base operator)

$$\alpha^{s} \langle op \rangle \beta = (\alpha \langle op \rangle \beta)^{s}$$

• Transfer function for au-functions ($eta=x_1\sqcup x_2\sqcup\dots$)

$$\tau(x_0, x_1, \dots, x_n) \sqcup \begin{cases} x_0 \sqcup \top & \text{if } x_0 \sqcup \beta \neq \top \\ \beta & \text{if } x_0 \sqcup \beta = \top \land \beta \in C^s \\ \beta^s & \text{otherwise} \end{cases}$$

Speculative Sparse Conditional Constant Propagation (SSCCP)

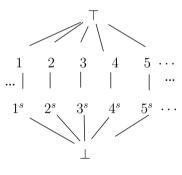

- Introduce new speculative values $\{\ldots,1^s,2^s,\ldots\}\in\mathcal{C}^S$
- Operation with speculative values result in speculative results (with same semantics as base operator)

$$\alpha^{s} \langle op \rangle \beta = (\alpha \langle op \rangle \beta)^{s}$$

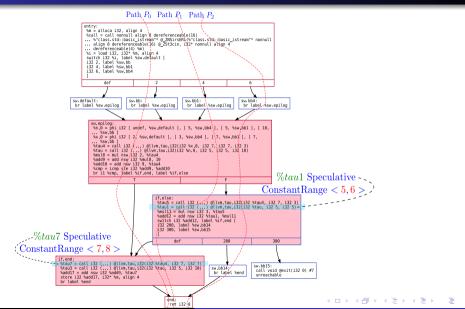

• Transfer function for au-functions ($eta=x_1\sqcup x_2\sqcup\dots$)

$$\tau(x_0, x_1, \dots, x_n) \sqcup \begin{cases} x_0 \sqcup \top & \text{if } x_0 \sqcup \beta \neq \top \\ \beta & \text{if } x_0 \sqcup \beta = \top \land \beta \in C^s \\ \beta^s & \text{otherwise} \end{cases}$$

 eta^s otherwise Almost trivial to generate profile-guided variants of standard analyses—it took us an afternoon to "port" SCCP to SSCCP!

Profile Guided SSCCP Pass in LLVM

LLVM Implementation: Profile Guided SSCCP Pass

- Modified the existing SCCP Pass to add visitTauNode() function which handles the special "11 vm, tau" intrinsic instructions used for τ -functions ¹
- Added a new lattice element type "spec_constant" in ValueLattice class supporting operations on speculative constants. Modified the SCCPInstVisitor::mergeIn() function to handle lattice "meet" operation for the new speculative constants introduced.
- Added new functions in the SCCPInstVisitor and SCCPSolver class to handle operations on speculative constants. Eg. Operands can be marked speculative using as function markSpeculativeConstant().
- Modified the SCCPInstVisitor::solve(), function to process "llvm.tau" intrinsic instructions using visitTauNode() instead of the standard visit() function.

¹Since we added the τ -functions as an "llvm.tau" intrinsic, we blocked processing it as a regular LLVM Instruction 4 D > 4 B > 4 B > 4 B > 9 Q P

Hot/Cold Paths

Definition 1. Hot/Cold Paths

A program path $p: n_1 \rightsquigarrow n_2$ is said to be hot (cold) if the sequence of edges from node n_1 to n_2 appears (does not appear) in any profiled path that occurs frequently in the program profile.

Hot/Cold Paths

Definition 1. Hot/Cold Paths

A program path $p: n_1 \rightsquigarrow n_2$ is said to be hot (cold) if the sequence of edges from node n_1 to n_2 appears (does not appear) in any profiled path that occurs frequently in the program profile.

Definition 2. Temperature (θ) of a node (edge)

- hot: if the node (edge) is present on a hot path;
- cold: if the node (edge) is not present on any hot path.

Hot/Cold Paths

Definition 1. Hot/Cold Paths

A program path $p: n_1 \rightsquigarrow n_2$ is said to be hot (cold) if the sequence of edges from node n_1 to n_2 appears (does not appear) in any profiled path that occurs frequently in the program profile.

Definition 2. Temperature (θ) of a node (edge)

- hot: if the node (edge) is present on a hot path;
- cold: if the node (edge) is not present on any hot path.

Definition 3. Hot/Cold Reaching Definitions and Definition Chains

A definition δ at a basic-block n_1 is said to reach a respective use at a basic-block n_2 hot if there exists a hot path from n_1 to n_2 , and δ is not killed along that path. A definition δ at a basic-block n_1 is said to reach a respective use at a basic-block n_2 cold if there does not exist a hot path from n_1 to n_2 , and δ is not killed at least along one cold path from n_1 to n_2 .

Inserting τ – functions

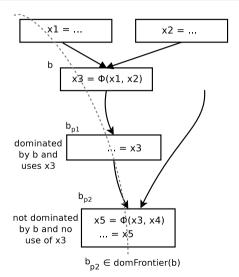

Necessary condition for τ -functions

Lemma 1. A node n requires a τ -function for variable x due to a definition d^x (of a variable x) if

- n is the junction of a hot and a cold path, i.e., paths at different temperatures meet at this node;
- on is reachable by at least two different definitions of the variable x.

Proof. If condition I fails, a τ -function is unnecessary as n can then be reachable by only hot or only cold definitions of x. If condition II fails, a τ -function is again unnecessary as the node is then dominated by a definition of x.

Inserting τ -functions

Inserting τ – functions

Definition 4. Thermal Frontier (TF)

For definition d defined at a node u reaching v, v is in the Thermal Frontier of (u,d), $v \in TF(u,d)$, iff

- the node v is also exposed to a reaching definition d' defined at a node $u \notin Dom(w)$ (w not dominated by u)
- $\theta(u \leadsto v) \neq \theta(w \leadsto v)$
- \bullet v is the first node on the paths $u \rightsquigarrow v$ and $w \rightsquigarrow v$ that satisfies the above properties.

Inserting τ – functions

Definition 4. Thermal Frontier (TF)

For definition d defined at a node u reaching v, v is in the Thermal Frontier of (u,d), $v \in TF(u,d)$, iff

- the node v is also exposed to a reaching definition d' defined at a node $u \notin Dom(w)$ (w not dominated by u)
- $\theta(u \leadsto v) \neq \theta(w \leadsto v)$
- \bullet v is the first node on the paths $u \rightsquigarrow v$ and $w \rightsquigarrow v$ that satisfies the above properties.

Theorem

For a set of visible definitions of a variable x at a set of nodes κ , τ -statements are only required at the Iterated Thermal Frontier ITF^{x} for variable x.

HPSSA construction [Roy et al., CC'10]

- Insert ϕ -functions:
 - insert ϕ -functions at the *iterated dominance frontiers*
- Insert τ -functions
 - insert τ -functions at the *iterated thermal frontiers*
- Allocate arguments to ϕ -functions
 - ullet use a variable stack to allocate the ϕ -function arguments
- Allocate arguments to τ -functions
 - maintain path-sensitive reaching definitions for each program variable corresponding to each hot path on a path-sensitive stack;
 - for each instruction in the program, the algorithm update the respective stack to record the change in the path-sensitive reaching definitions due to the instruction;
 - when a τ -function is encountered, the current set of reaching definitions on the stack is used to allocate the speculative arguments for the τ -function.

HPSSA construction over SSA [Jaiswal et. al., SCOPES'17]

Difficulties,

- Needs the SSA construction identified, broken into and retrofitted with the HPSSA construction phases.
- The algorithm is quite complex!

HPSSA construction over SSA [Jaiswal et. al., SCOPES'17]

Difficulties

Introduction

- Needs the SSA construction identified, broken into and retrofitted with the HPSSA construction phases.
- The algorithm is quite complex!

HPSSA over SSA

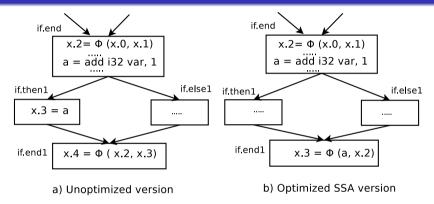

- Easily incorporated within existing compilers: Construction over the SSA form
- Efficient: Lesser instructions have to be traversed
- Simpler: many constructs are eliminated

Conclusions

A naïve attempt: Mimic [Roy et al.]

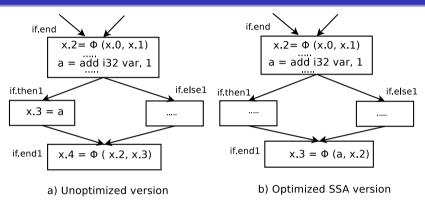

- attempt to "recover" the renamed versions of each base variable that is merged by the ϕ -functions:
- then, allocate a single path-sensitive stack for all versions of the same base variable.

Optimized SSA forms

a and x.2 are live simultaneously — hence, cannot be different versions of the same variable

a and x.2 are live simultaneously — hence, cannot be different versions of the same variable

in the above example, copy propagation breaks the phi congruence property...

$\phi-congruence$ property

Shreedhar et al. [SAS'99]

"The occurrences of all resources which belong to the same phi congruence class in a program can be replaced by a representative resource. After the replacement, the phi instruction can be eliminated without violating the semantics of the original program."

- Sreedhar et al. circumvent the problem by translating the optimized SSA form to the conventional SSA form (that satisfies the phi congruence property) before translating out of SSA.
- We directly build the HPSSA form over the optimized SSA form!

Brief Algorithm

- Insert τ -functions
 - Insert at Thermal Frontiers
- Allocate arguments to τ -functions
 - path-sensitive traversal through the program to identify definitions that reach au-functions through hot paths
 - ullet constrains its inspection to only the ϕ -functions and the au-functions

Allocating τ -function arguments

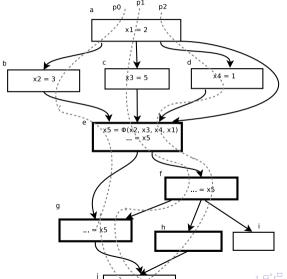

Uses a path-sensitive stack: phiStack

- phiStack is a stack of frames
- each frame $\langle d_i, \xi_i \rangle$ where $\xi_i = \{p_1, p_2, \dots\}$
- support operations:
 - push(frame f, block b)
 - pop(block b)

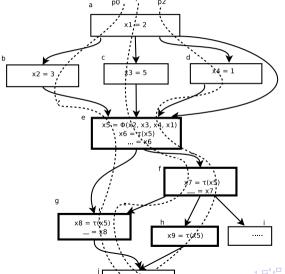

High-level algorithm

- ullet Load arguments from ϕ and au-functions along with their hot path sets on **phiStack**
- ullet Assign the definition from the topmost frame of **phiStack** to any au-function encountered

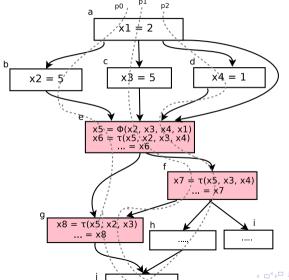

SSA program

au-functions inserted

au-arguments allocated

What we modified in LLVM Source?

 New llvm::intrinsic signature, "llvm.tau" to support addition and removal of τ-functions to the LLVM SSA IR representation.

```
+ //===-//
+ def int_tau : DefaultAttrsIntrinsic<[llvm_any_ty],
+ [llvm_vararg_ty],
+ []>;
```

10 11 Modified Verifier::verifyDominatesUse() function since we don't want our intrinsic to interfere with dominators computation.

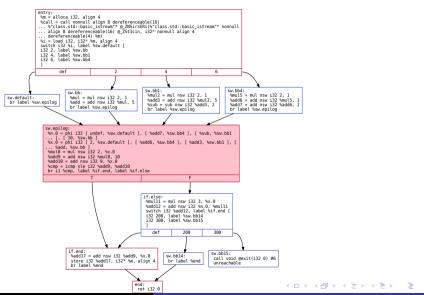

```
+ //===-//
void Verifier::verifyDominatesUse(Instruction &I, unsigned i) {
   Instruction *0p = cast<Instruction>(I.getOperand(i));
   + if (CallInst *CI = dyn_cast<CallInst>(&I)) {
        + Function *CallFunction = CI->getCalledFunction();
        + if (CallFunction != NULL && CallFunction->getIntrinsicID()==
        + Function::lookupIntrinsicID("llvm.tau")) {
        + return;
        + }
        + }
}
```

HPSSAPass: Overview

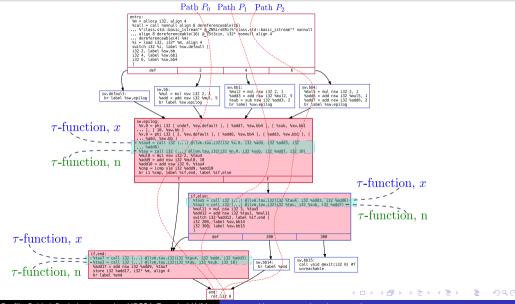

- class HPSSAPass : public PassInfoMixin<HPSSAPass>
 - Implemented llvm::HPSSAPass pass using the new LLVM Pass Manager.
 - Function HPSSAPass::run(Function &F, ...) runs over a llvm::Function and inserts
 "llvm.tau" intrinsic calls with speculative and safe arguments at strategic positions in the
 LLVM IR and handles argument allocation for "llvm.tau" intrinsic calls as described in the
 previous slides.
- Key HPSSA Data Structures :
 - Hot Path Set using llvm::BitVector for maintaining hot paths in the program.
 - Definition Accumalator, defAccumulator(op, currBB) function. The argument "op" is a phi argument that reaches basic-block "currBB" via hot path.
 - A stack of map values std::map<Value*, Value*> to store the most "recent" tau definition encountered so far corresponding for a tau variable used later in variable renaming.

SSA Form

Hot Path SSA Form

HPSSAPass: Main Pass

- HPSSAPass::run(Function &F, FunctionAnalysisManager &AM)
 - Invoke HPSSAPass::getProfileInfo() function to get a compact representation of all the profiled hot paths in the program and then call HPSSAPass::getCaloricConnector() to get all the caloric connectors from the hot path information. This is a precursor to finding strategic positions to place "llvm.tau" intrinsic calls in the LLVM IR.
 - Runs over each basic block in the function "F" in topological order using iterator returned from llvm::Function::RPOT() call.
 - Uses the llvm::dominates() function from llvm::DominatorTreeAnalysis to check for
 dominance frontier while processing the child nodes of the current basic block. This step is
 a part of correctly placing "llvm.tau" intrinsic calls in the LLVM IR.
 - Uses the renaming stack and HPSSAPass::Search() function to search and replace all use
 of PHI result operand with that returned by the "llvm.tau" intrinsic call.

HPSSAPass: Destruction Pass

- Out of HPSSA Form.
 - A seperate pass using the new LLVM Pass Manager.
 class TDSTRPass : public PassInfoMixin<TDSTRPass>
 - Using TDSTRPass::run(Function &F, ...), we replace all use of existing tau
 operands with first argument of "llvm.tau" intrinsic (corresponds to the safe
 argument) and remove the "llvm.tau" intrinsic call from the LLVM IR.
 - The LLVM IR becomes identical to what it was before running the HPSSA Pass.

Presentation Outline: Section 4

- HPSSA: Why another SSA Form?
 - Profile Guided Optimization
 - Doing Profile Guided Optimizations is Hard!
 - Profile Guided SSCCP Analysis using HPSSA Form
- 2 What is HPSSA form?
 - Hot Path SSA Form
 - Profile Guided SSCCP Pass
- How is HPSSA Implemented?
 - Constructing HPSSA Form
 - Implementing HPSSA Form in LLVM
- Implementing in 33A roini in ELVIV
- 4 Conclusion

Conclusion
